

ABC Technologies
Software Deployment Guide

1. Pre-Deployment Checks

All automated tests must pass before an application is deployed.

The deployment team should verify configuration settings and environment variables before deployment.

2. Build Process

The application must be built using the approved build process defined by the development team.

3. Deployment Environment

Applications should be tested in the staging environment before being deployed to production.

4. Production Deployment

Production deployments should be performed during approved deployment windows.

5. Monitoring

After deployment, the application should be monitored for errors, performance issues, and service availability.

6. Rollback

If a critical problem is detected after deployment, the deployment team should follow the approved rollback procedure.

7. Security

Production credentials and secrets must be stored securely and must not be included directly in application source code.
